A durable and ecofriendly material for decking, garden fences and exterior cladding

Respectful of the environment

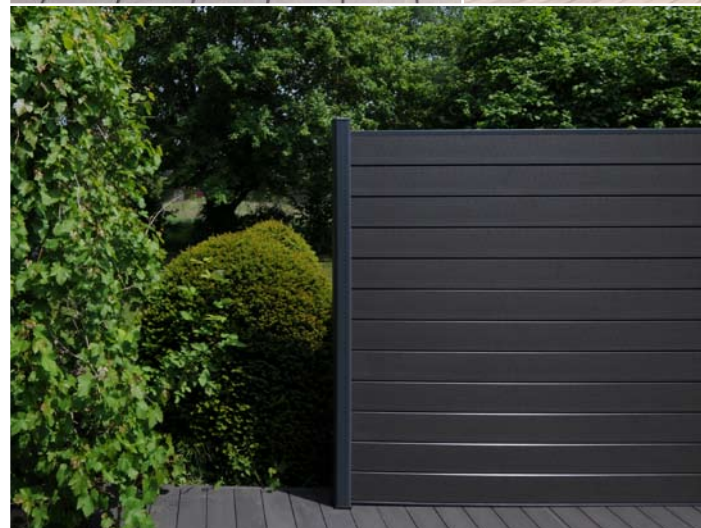

LIME Composite is made from 90% recycled material: recovery of sawdust and recycled high density polyethylene. A mix of wood (60%) and polyethylene (30%) that does not fear temperature variations. And does not split. 10% additives enhance the longevity of the material and its colour. The choice of colors is based on the natural elements sand, wood and stone .

Comfortable and aesthetic

The very thin composition and matte brushed surface of LIME Composite gives a natural look and is pleasant to the touch, comfortable for walking. No risk of splinters.

Invisible fastening and technical profiles

The technique also serves the aesthetics. The terraces are fixed with the B-Fix fastening, totally invisible, hidden by the covering part of the B-Fix Premium profile of the terrace board. For cladding, invisible fastening and aluminium profiles make ventilation possible and ensure a nice look. Garden screens are also very easy to install thanks to the modular posts. All these matching elements create an harmonious space.
